

# A Systematic Review of the Safety Climate Intervention Literature: Past Trends and Future Directions

**Emily (Yueng-Hsiang)  
Huang, Ph.D.**

**Jin Lee, Ph.D.**

# Liberty Mutual 2020 Workplace Safety Index

Total cost of the most disabling workplace injuries: **\$59.59 billion**

	Cost billions	Percent total	
1.	\$13.98	23.5%	Overexertion involving outside sources (Handling objects)
2.	\$10.84	18.2%	Falls on same level
3.	\$6.12	10.3%	Struck by object or equipment (Being hit by objects)
4.	\$5.71	9.6%	Falls to lower level
5.	\$4.69	7.9%	Other exertions or bodily reactions
6.	\$3.56	6.0%	Roadway incidents involving motorized land vehicle (Vehicle crashes)*
7.	\$2.06	3.5%	Slip or trip without fall
8.	\$2.05	3.4%	Repetitive motions involving microtasks
9.	\$2.00	3.4%	Struck against object or equipment (Colliding with objects)
10.	\$1.92	3.2%	Caught in or compressed by equipment or objects (Running equipment or machines)

\* Typically involving a car or truck

# Beyond the Traditional Approaches

Risk Managers and Safety Directors are now exploring **organizational and psychosocial factors** in the workplace to complement other approaches in an attempt to make further improvements.

*Safety Climate/Safety Culture investigations are a major part of this effort.*

# Definition of Safety Climate

- First introduced by Dov Zohar (1980)
- Safety Climate (SC):
  - Employees' perceptions of the safety policies, procedures, and practices at a given point in time
  - Overall importance and “true” priority of safety at work

# Definition of Safety Climate

## The #1 Dimension

### **Managerial Commitment to Safety:**

Prioritize safety over delivery & other competing demands across range of situations

# Meta-Analysis by Christian, et al. (2009)

## Combined Results of 90 Studies

Safety Climate is a robust predictor of future injury

# Psychological Theories:

the links between Safety Climate and outcomes

## Theory of Planned Behavior (Ajzen, 1991)

# Psychological Theories:

the links between Safety Climate and outcomes

## Social Exchange Theory (Cropanzano & Mitchell, 2005)

# The Impact of Safety Climate Extends Beyond Safety Outcomes

Huang, et al.,  
*Applied Ergonomics*, 2016

SC has significant impact on employees' job satisfaction, employee engagement and objective turnover rate.

# A Systematic Review of the Safety Climate Intervention Literature

- Lee, J., Huang, Y. H., Cheung, J. H., Chen, Z., & Shaw, W. S. (2019). A systematic review of the safety climate intervention literature: Past trends and future directions. *Journal of Occupational Health Psychology*, 24(1), 66-91.
- <https://psycnet.apa.org/doiLanding?doi=10.1037%2Focp0000113>

# Safety Climate Intervention

- SC Intervention promotes Occupational Safety & Health (OSH) through SC
  - Enhanced SC may not be an ultimate goal but a byproduct of targeted efforts to improve work systems
- DeJoy et al. (2015)
  - All kinds of endeavors that promote the safety saliency could be viewed as SC interventions
  - Any efforts to promote safety behaviors & reduce accident, injury, & fatality rates can result in SC promotion

# Study Purposes

- Categorize & summarize the different types of efforts to improve SC in varying occupational contexts
  - SC interventions were those specifically intended to show a marked change in safety attitudes and norms across the organization
  - SC interventions were classified based on the work system components of the socio-technical systems framework (STS; Hendrick & Kleiner, 2002)

# Study Purposes (continued)

- Synthesize empirical evidence on the effectiveness of interventions & strategies in advancing SC
  - Effectiveness was determined by a meaningful increase in SC scores after the implementation of the SC intervention compared to pre-intervention or control condition.

# Taxonomy of 5 Subsystems of the Socio-Technical Systems Framework

<b>1.External Environment</b>	<ul style="list-style-type: none"><li>▪ Political / Legal (regulations)</li><li>▪ Cultural / Educational</li><li>▪ Technological / Economic</li><li>▪ Environmental / Market driven &amp; competition</li></ul>
<b>2. Organizational &amp; Managerial Structure</b>	<ul style="list-style-type: none"><li>▪ How the organization is designed<ul style="list-style-type: none"><li>- organizational hierarchy</li><li>- managerial values</li></ul></li></ul>
<b>3. Technical Subsystems</b>	<ul style="list-style-type: none"><li>▪ How work is performed<ul style="list-style-type: none"><li>- job design</li><li>- hardware / software design</li></ul></li></ul>
<b>4. Personnel Subsystems</b>	<ul style="list-style-type: none"><li>▪ Who performs the work<ul style="list-style-type: none"><li>- personnel</li><li>- training (knowledge, skills &amp; abilities)</li></ul></li></ul>
<b>5. Internal Environment</b>	<ul style="list-style-type: none"><li>▪ Psychosocial &amp; physical<ul style="list-style-type: none"><li>- work-related psychosocial factors</li><li>- physical work environment</li></ul></li></ul>

# Review of SC Intervention Literature

- Characteristics of study sample & design
  - Sample: size, job types, ranks, & occupational contexts
  - Research design:
    - Design types (e.g., within-/between-subjects design),
    - Number of conditions
    - Time scheme (e.g., frequency & duration of intervention; interval between the study phases)

# Review of SC Intervention Literature (continued)

- Intervention strategies
  - Key factors addressed by the intervention (e.g., communication, leadership, & physical environment)
  - Specific strategies & procedures of the intervention
  - Differences between control & intervention conditions or before & after the intervention
  - Interventions were categorized by 5 subsystems of Socio-Technical Systems (STS) framework

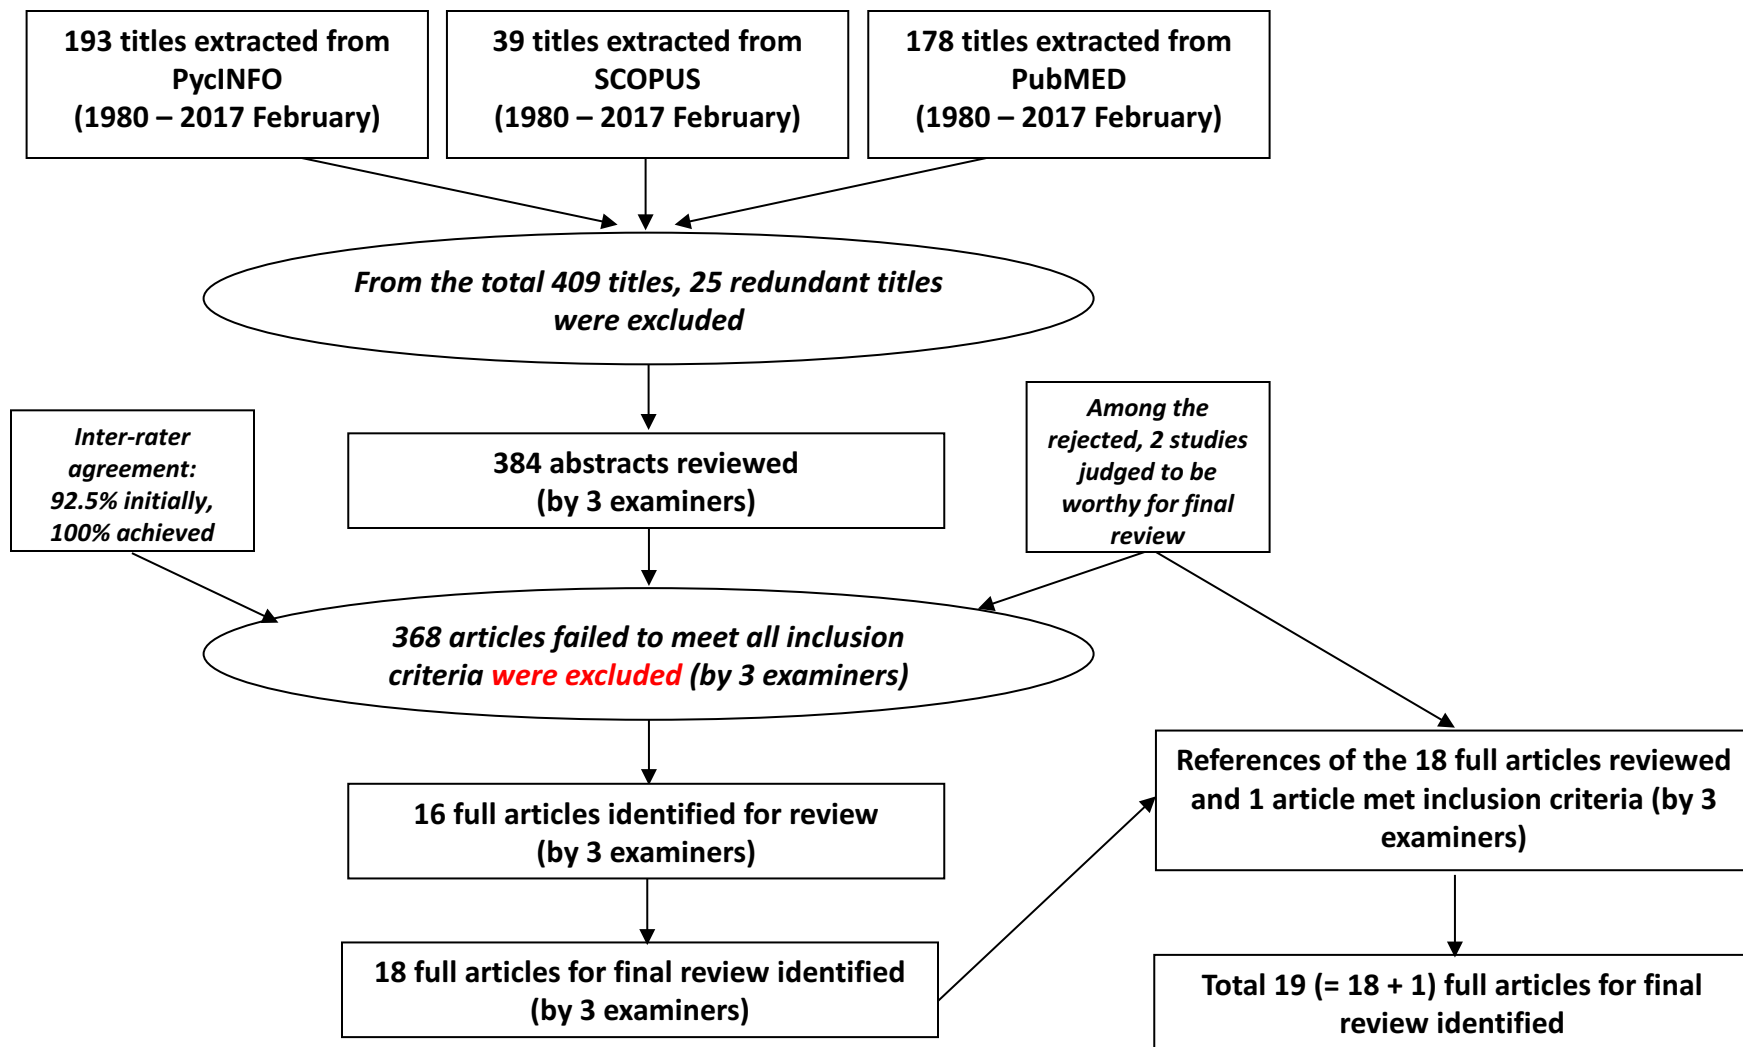

# Review of SC Intervention Literature (continued)

- Intervention outcomes
  - Magnitude of change in SC scores (or observations) between control & intervention conditions or before & after the interventions
  - Where available, effect size statistics were noted to evaluate the effectiveness of the intervention
- Limitations
  - Study authors pointed out potential limitations & weaknesses in terms of the study design & safety climate intervention strategies

# Inclusion & Exclusion Criteria

Category	Inclusion Criteria	Exclusion Criteria
<b>Keywords</b>	<ul style="list-style-type: none"> <li>▪ “Safety climate/culture” &amp; “intervention”</li> </ul>	
<b>Research setting</b>	<ul style="list-style-type: none"> <li>▪ Various workplaces with more or less occupational safety &amp; hazards</li> </ul>	<ul style="list-style-type: none"> <li>▪ Patient safety climate/culture</li> </ul>
<b>Research design</b>	<ul style="list-style-type: none"> <li>▪ Based on an experimental design - between/within subject design</li> </ul>	
<b>Intervention</b>	<ul style="list-style-type: none"> <li>▪ Offering specific administrative info - focus, target, time scheme</li> </ul>	
<b>Outcome variable</b>	<ul style="list-style-type: none"> <li>▪ SC or any of sub-dimensions - change score - before &amp; after intervention - control vs. intervention group</li> </ul>	<ul style="list-style-type: none"> <li>▪ Only one time measure or qualitative observation of SC or any of sub-dimensions</li> </ul>

# Scientific Literature Search Procedure

# Results

- 19 studies for final review
  - Very limited number of studies on the effectiveness of SC interventions
  - J. of Safety Research (26.3%), Safety Science (15.8%), J. of Applied Psychology (10.5%)
  - Zohar's (2002) study was the first in implementing a SC intervention & scientifically examining its effectiveness
  - Study sites: Denmark (31.6%) & USA (26.3%) / manufacturing, metal processing, food processing, construction, railroad service, etc.

# Results (continued)

- Study design
  - 52.6%: Quasi-experimental pre- & post-intervention design
  - 42.1%: Mixed-design approach (both between- & within-subject design)
  - Olsen et al. (2009) adopted a pre-experimental design
  - Randomization considered in only 26.3%
- Intervention Duration
  - Ranged from 4 weeks (Haas, Cecala, & Hoebbel, 2016) to 3 years (Nielsen, Carstensen, & Rasmussen, 2006).

# Results (continued)

- All interventions in the 19 studies involved either OSH communication or education/training
  - 47.4% involved **improvement of safety leadership**
  - 26.3% involved **physical work environment improvement**
  - 21.1% incorporated **technological aspects of work** into SC interventions

# Results (continued)

Safety Climate intervention activities	Frequency (%)
1. Set up and/or improve a health & safety organization committee	3 (15.8%)
2. Observe, inspect, & record occupational hazards & at-risk safety behavior	5 (26.3%)
3. Conduct collective brainstorming (among all levels of employees) to identify safety issues	5 (26.3%)
4. Conduct collective brainstorming (among all level of employees) for possible safety solutions	4 (20.1%)
5. Review & prioritize perceived problems & potential solutions	2 (10.6%)
6. Create opportunities for communication regarding safety through discussion & dialogue meetings	12 (63.2%)
7. Provide management with safety leadership training & development	9 (47.4%)
8. Provide supervisors with safety training & coaching sections	7 (36.8%)
9. Provide safety training to employees	8 (42.1%)
10. Use of technology, tools/equipment to monitor and/or improve safety	4 (20.1%)
11. Institute specific programs to improve physical work conditions	6 (31.6%)
12. Institute specific programs to minimize at-risk behaviors	5 (26.3%)
13. Set up system with metrics to track safety performance	3 (15.8%)
14. Collect feedback, evaluate progress, & set goals (individual & company) for improving safety	11 (57.9%)
15. Create working groups to address specific areas of safety concerns	1 (5.3%)
16. Incentivize & reward good safety behavior & outcomes	1 (5.3%)

# Results (continued)

- STS mapping
  - All 19 interventions were categorized as focusing on improving ***organizational & managerial structure*** as well as ***personnel subsystem***
  - 26.3% aimed at improving ***internal (physical) work subsystem*** & 21.1% also aimed at improving ***technical subsystem***

# Results (continued)

- 89.5% of studies showed a statistically significant improvement in SC (or its sub-dimensions)
- In some studies, statistically significant improvement in SC was found only in certain contexts
  - The supervisor action dimension of SC improved, but supervisor expectation dimension did not improve in Nielsen (2014)
  - Statistically significant increases in SC scores were found in one plant but not in another (Nielsen et al., 2006)

# Results (continued)

- Limitations
  - Difficulty executing strictly controlled randomization of participants for applied field intervention studies
  - Inability to experimentally control uncertain external contexts (e.g., economic/market situation & socio-cultural aspects)
  - Engagement of organizational members in interventions (e.g., low response rate & attrition over the study duration)

# Discussion

- Lack of study on the effectiveness of SC intervention (Zohar & Polachek, 2013)
  - SC is a multi-faceted & collective notion that is difficult to understand & assess in a simple and unified manner
  - Most SC research tends not to treat SC as a DV, but as an antecedent of safety behavior & objective safety outcomes (Griffin & Curcuruto, 2016; Zohar, 2010)

# Discussion (continued)

- Primary emphasis of extant SC interventions is on organizational & managerial aspects of work
  - SC is an organizational construct based on OSH management & leadership
  - A broader range of intervention efforts can be considered focusing on “person-situation interactions” (Guastello, 1993)
- Future studies on potential antecedents of safety climate, other than known organizational & managerial factors, are required

# Discussion (continued)

- Systematic needs-assessment is needed for the design/implementation of SC interventions
  - For most reviewed studies, the process of SC intervention design was primarily initiated by researchers, not by workers

# Discussion (continued)

- Better practices of SC assessment needed for testing the effectiveness of SC interventions
  - SC assessment of SC dimensions pertinent to the SC intervention program is critical
  - Timelines of SC assessment across different phases of intervention needs to be carefully thought out (Zohar & Polachek, 2014)

# Discussion (continued)

- Recommendations
  - Inclusion of process measure(s) of SC intervention
  - Adoption of a multiple-baseline design which may enable observation of when the effectiveness of a SC intervention become remarkable
  - More than 2 follow-up measures over time because it may take a longer time to observe actual change in SC
  - Proper level of measurement; consideration of both SC level & strength
